Architecture Of Spring

As we can see in the architecture core module is the base module. It is the foundation module of spring. We can use any required module in combination with core module without disturbing the other module.

There is no interconnection between modules.

To start working with spring developer need not to learn each and every module they can start working just having the knowledge of required module.

For example we can work on persistence layer by learning spring jdbc module only.

Similarly we can work on crosscutting logic by learning AOP (Aspect Oriented Programming) module.

MVC module (Top module in the architecture) can be used with any module to develop web applications.
